FVN Research Archive 001 - Library Index

Lead Quantitative Researcher release map for library storage and public presentation.

Purpose

This index is the top-level guide for FVN Research Archive 001: Disclosure-Fundamental Mismatch. It explains what is included, how the archive should be read, which artifacts are public, and which outputs remain internal.

Area	Current archive status
Repository architecture	Implemented and validated
Test suite	192 passed in final archive freeze validation
Smoke runner	Implemented for deterministic synthetic end-to-end proof
Schema contracts	Implemented for critical live/smoke artifacts
Lineage graph	Implemented with nodes, edges, run-order links
Publication package	Implemented and sanitized
Final archive freeze	Implemented with checksums and immutable metadata
Live empirical run	Not included here; requires live-data readiness inputs

Recommended presentation order

- Start with the Executive Brief for the thesis and archive status.
- Use the Research Note Methodology as the serious institutional memo.
- Use the Reproducibility Runbook for commands and replay logic.
- Use the Audit Controls report for controls, gates, lineage, contracts, and freeze evidence.
- Use the Publication and Storage Guide when uploading to the FVN Library.

Canonical artifacts

Artifact	Role
publication_package_v0.zip	Sanitized public release bundle
reproducibility_pack.zip	Audit manifest, checksums, run order
final_archive_frozen_manifest.json	Canonical freeze manifest
final_archive_release_metadata.json	Release version/status metadata

Artifact	Role
final_archive_release_notes.md	Library storage release notes
PUBLICATION_README.md	Public-facing landing page

Important boundary

Archive 001 v0 is library-grade research infrastructure and a complete audit/release framework. It does not claim a live-data empirical alpha result until raw source data is configured, live readiness passes, and the live pipeline is executed.
