

FVN Research

Executive Brief

A concise presentation of the first FVN Library research archive.

One-sentence thesis

A company's forward returns may contain information when hard accounting fundamentals and management disclosure tone disagree.

Research object

The project is not just a signal idea. It is a complete reproducible research object: hypothesis, point-in-time data design, feature layers, model evaluation, portfolio construction, ablation logic, audit controls, publication package, and final archive freeze.

What has been completed

Area	Current archive status
Repository architecture	Implemented and validated
Test suite	192 passed in final archive freeze validation
Smoke runner	Implemented for deterministic synthetic end-to-end proof
Schema contracts	Implemented for critical live/smoke artifacts
Lineage graph	Implemented with nodes, edges, run-order links
Publication package	Implemented and sanitized
Final archive freeze	Implemented with checksums and immutable metadata
Live empirical run	Not included here; requires live-data readiness inputs

How I would present this publicly

- As FVN Research Archive 001, not as a casual alpha post.
- As a library-grade framework first, empirical alpha note second.
- As a reproducibility and audit standard that future FVN research must match.
- As the start of the FVN Library style: research thesis, evidence chain, controls, sanitized public package, and immutable freeze.
