Final Archive Freeze Record

Immutable release metadata, artifact checksums, and library storage intent.

Freeze status

The final archive freeze layer has been implemented. It generates release metadata, artifact inventory, SHA256 checksums, release notes, frozen audit manifest, and diagnostics.

Freeze rule

The archive is FROZEN only when the release version is valid, all required artifacts exist, the publication package exists, and the configured release gate passes. Otherwise the archive is BLOCKED.

Canonical freeze outputs

Output	Purpose
final_archive_freeze_manifest.csv	Artifact inventory and checksums
final_archive_release_metadata.csv/json	Release version and status metadata
final_archive_frozen_manifest.json	Canonical frozen audit manifest
final_archive_release_notes.md	Human-readable library notes
final_archive_freeze_diagnostics.csv	Freeze diagnostics

Library storage recommendation

Store the latest repo ZIP together with this PDF kit, the sanitized publication package, and the freeze/audit metadata. That makes the project replayable, inspectable, and presentation-ready.
